## **Prefabricated construction techniques 'improving'**

The use of prefabricated construction techniques is improving, a Swedish sheet metal producer has claimed.

According to Plannja, the use of prefabricated techniques is increasingly used in a number of countries - including Sweden – and is being utilised for many different types of construction, reports Forbes.

The firm's product range includes roofing-sheets and tiles, profiled wall cladding and wall cassettes, manufactured using Swedish steel and aluminium.

"We aim to be the building industry's number one choice as a partner for the supply of thin steel sheet building products and systems," said Plannja.

"Plannja is a secure, problem-solving partner that makes building easy, cost efficient and aesthetically appealing," the company added.

Established in 1967, the firm operates in a number of markets, including the Czech Republic and Ukraine.
